

How To Use the cPanel File Manager

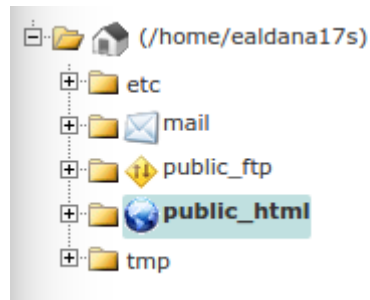

1. Login to your cPanel using your correct username and password credentials

2. Scroll down the “Files” section and locate the “File Manager” folder icon.
3. Click this icon and select “Document Root” for your website as shown below.

4. You will now see a file tree on the left like this.
All of your websites files will be located in “public_html”. Select this folder.

5. On the right you will see all of the files in your folder. This may be empty. You will need to upload all of your website files by using the bar at the top.

TIP: If you want to make this step faster, consider using an FTP. It is the fastest way.

If you still prefer File Manager, a faster way is uploading a compressed archive of your site (eg. .zip), uploading it, and clicking “extract” at the bar on the top.

6. After uploading your files your “public_html” should look something like this!
